

ERDE AGRO ECOSYSTEMS PVT. LTD.

About Erde Agro

ERDE AGRO is a technology-driven agriculture company committed to transforming farming through innovation, sustainability, and smart agricultural solutions. We work closely with farmers, FPOs, agri-input companies, financial institutions, and market partners to build a strong and transparent agricultural ecosystem. Our focus is to improve farm productivity, profitability, and sustainability by providing integrated solutions such as soil testing, smart farm monitoring, crop advisory, farm digitization, supply chain management, input supply, and market linkages. At Erde Agro, we believe that empowered farmers create stronger agriculture and a better future. We work towards the ‘Capacity Building of FPO’s’ and ‘Supply Securities’ to our buyers.

Why Erde Agro?

Because we don’t just support farming — we build sustainable agricultural success through technology, trust, and partnerships.

Our Vision

To transform agriculture through technology, innovation, sustainable farming, and secure agricultural supply systems by empowering farmers, improving productivity, and building a strong farm-to-market ecosystem. We envision a future where every farmer has access to modern agricultural solutions, better income opportunities, supply security, and sustainable farming systems.

Our Mission

-  Empower Farmers
-  Promote Sustainable Agriculture
-  Digital Farm Transformation
-  Soil & Crop Health Improvement
-  Supply Securities
-  Strengthen Market Linkages

Empowering Farmers. Securing Agriculture. Transforming Futures.

Why Join Partnering with ERDE AGRO?

- **Farmer-Centric Approach:** ERDE AGRO prioritizes farmers' needs by providing practical solutions, knowledge, and support that help improve farming efficiency, productivity, and income.
- **Sustainable Growth:** Promotes sustainable and eco-friendly agricultural practices that improve soil health, conserve resources, and support long-term farm productivity.
- **Technology-Driven Solutions:** Uses modern agricultural technologies and innovative solutions to help farmers make better decisions, improve productivity, and manage farming challenges effectively.
- **Scientific Agriculture Support:** Provides science-based agricultural guidance, including soil and crop-related insights, to encourage informed and effective farming practices.

- **Digital Farm Management:** Supports farmers with digital tools and management solutions for better monitoring, planning, tracking, and overall farm operations.
- **Reliable Supply Security:** Helps ensure consistent access to quality agricultural inputs and resources, reducing supply-related challenges for farmers.
- **Strong Market Linkages:** Builds connections between farmers and markets, helping improve access to buyers, strengthen market opportunities, and support better returns.

Complete Products / Crops List

1. Spices

- Dry Red Chili
- Cumin
- Coriander Seeds
- Fenugreek Seeds
- Fennel
- Turmeric Dry
- Ginger Dry
- Black Pepper
- Cardamom (Green & Black)
- Nutmeg
- Cinnamon

2. Cereals / Grains

- Maize
- Wheat

3. Pulses / Millets

- Green Gram
- Red Gram / Pigeon Peas
- Chickpeas
- Lentils
- Black Gram
- Pearl Millets
- Finger Millets
- Sorghum

4. Fruits & Others

- Pineapple (Assam)
- Orange (Assam)
- Areca Nut (Supari)

Erde Agro Ecosystem – Integrated Agriculture Solutions

What We Provide to FPOs?

Erde Agro Ecosystems provides multiple agriculture-related services and business solutions to Farmer Producer Organizations (FPOs). These include direct input supply, satellite imagery and data services, crop insurance, soil testing, market linkage, finance and credit support, and digitally enabled farm-management solutions through the Farm App. Through these services, Erde Agro aims to support FPOs in improving their operations, connecting farmers with quality

agricultural inputs and services, accessing markets and buyers, using technology for farm monitoring and management, accessing financial facilities, and creating sustainable revenue opportunities. The company works with various partners and organizations across input supply, market linkage, finance, soil testing and technology services.

Direct Input Supply

Erde Agro supports FPOs through a direct input-supply model in partnership with organizations including IFFCO, BBSSL and Reliance. Through the FPO franchise and dealership model, FPOs can become authorized dealers or centres for agriculture-related products and services and provide farmers access to genuine and certified-quality agricultural inputs. The services available through this model include agricultural inputs, seeds, fertilizers, soil testing, finance and the Erde Agro Farm App. The model is intended to improve farmers' access to agricultural inputs and services while enabling FPOs to develop an agriculture-related business and service centre for their farmer members. Input-supply dealerships are also described as one of the potential revenue streams for FPOs.

Satellite Imagery and Data Services

Erde Agro provides satellite-based, real-time farm monitoring and data-enabled agricultural services. Its technology ecosystem includes collaboration with Irriwatch-Hydrosat and the Irriwatch App. The Erde Agro Farm App also incorporates weather data, satellite data and geo-spatial information for digitally enabled farm management. Satellite and geo-spatial information can be used within the company's farm-management platform for monitoring agricultural conditions and supporting activities such as crop monitoring, irrigation planning, vegetation monitoring and other listed farm-management functions. The company's journey records agreements

with Irriwatch-Hydrosat, validation of the Irriwatch App and a Farm App trial with Olam Food.

Crop Insurance

Crop insurance is one of the services included in Erde Agro's FPO ecosystem. The company profile specifically mentions event-based crop insurance as an FPO-related service and also identifies insurance-premium collection commissions as one of the possible FPO revenue streams. This means the insurance-related model is connected with FPO operations and farmer services, while the company profile does not provide detailed information about individual insurance policies, premium amounts, claim procedures, eligibility conditions or specific insurance companies. Therefore, the chatbot should only provide the crop-insurance information available in the company profile and should not invent policy-specific details.

Soil Testing

Erde Agro provides soil-testing services as part of its agriculture ecosystem. The company has an MoU with Neoperk for near-farm-gate soil testing, making soil-testing services available closer to farmers. Soil-related information is also included in the Erde Agro Farm App, which lists parameters and information such as soil moisture, soil temperature and soil profile. Soil-testing and collection service fees are also identified as one of the possible revenue streams for FPOs. The source does not provide specific soil-test prices, laboratory test parameters beyond those listed, fertilizer recommendations or crop-wise nutrient doses, so the chatbot should not provide such information as if it came from the company profile.

Market Linkage

Market linkage is one of the major services provided by Erde Agro. The company connects farmers and FPOs with domestic and international buyers and works to create direct market access for agricultural produce. The company profile mentions direct buyer connections with organizations including ITC, Olam, Griffith and Amul. It also describes quality-based premium opportunities for IPM, residue-free and organic produce and highlights supply-chain transparency. Through this market-linkage model, FPOs can participate in organized agricultural value chains and help aggregate consistent-quality produce at scale for buyers. Market linkage is also identified as one of the revenue streams available to FPOs within the Erde Agro ecosystem.

Finance and Credit

Erde Agro's financial-enablement services are designed to connect FPOs and farmers with agriculture-related financial facilities. The company profile mentions working capital, warehouse receipt financing, agri-related funds and connections for crop loans. Axis Bank is specifically mentioned in the company's journey and financial ecosystem. The Farm App also includes FPO Finance, warehouse receipt finance and crop-loan connection. The company profile does not provide specific loan interest rates, loan amounts, eligibility criteria, repayment schedules or approval guarantees, so these details should not be generated by the chatbot unless they are provided separately in the knowledge base.

Farm App and Digital Agriculture Technology

The Erde Agro Farm App is a digitally enabled farm-management platform that brings together multiple agriculture-related technology and data services. The company profile describes the Farm App as covering irrigation, crop monitoring, soil health, climate, finance and GIS mapping. Its listed features include soil moisture, irrigation

planning, evapotranspiration, digital crop estimation, digital yield modelling, vegetation cover, crop nitrogen, soil temperature, soil profile, air temperature, vapour pressure deficit, FPO finance, warehouse receipt finance, crop-loan connection, Farm Agri Stack, geo-spatial data, weather data, satellite data and drought and flood monitoring. The platform is intended to use farm, weather, satellite and geo-spatial information to support digitally enabled farm management.

Irrigation and Soil Moisture Monitoring

The Farm App includes soil-moisture monitoring, an irrigation planner and evapotranspiration-related information. The company describes irrigation planning in relation to soil conditions, available water resources and irrigation systems. Root-zone soil-moisture information is used to understand whether the soil is dry, under stress or over-wet. These capabilities form part of the Farm App's digitally enabled approach to irrigation and farm management. The source does not provide crop-specific irrigation quantities, irrigation frequency or crop-wise water requirements, so those details should not be added to the chatbot unless they are available from another approved knowledge source.

Crop Monitoring, Yield and Vegetation Analysis

The Erde Agro Farm App includes digital crop estimation, digital yield modelling, vegetation-cover information and crop-nitrogen-related monitoring. The platform is designed to use digital and satellite-related information for farm monitoring. The company profile also mentions leaf nitrogen analysis, NDVI and yield estimation as part of its crop-monitoring capabilities. These technologies support monitoring of crop growth, vegetation condition, plant health and yield-related information. The company profile does

not provide specific crop-wise yield values or guaranteed yield improvements, so the chatbot should not make such claims.

Sowing Prediction

The Farm App includes sowing prediction based on soil temperature and soil moisture. These parameters are used to identify an optimal planting time within the technology platform. The company profile specifically mentions soil temperature and soil moisture in relation to sowing prediction. It does not provide fixed sowing dates for individual crops, regions or seasons, so the chatbot should not generate crop-specific sowing dates unless such information is separately added to the knowledge base.

Leaf Nitrogen and NDVI

Erde Agro's Farm App includes crop-nitrogen and leaf-nitrogen-related analysis for monitoring plant health and identifying nutrient-related conditions. The platform also includes NDVI-based vegetation monitoring. NDVI is presented within the company's crop-monitoring technology for tracking vegetation growth, health and stress areas. The company profile does not provide numerical thresholds or crop-specific interpretations for nitrogen or NDVI, so the chatbot should not create its own thresholds or recommendations.

Climate, Weather, GIS and Disaster Monitoring

The Farm App incorporates climate, weather, satellite and geo-spatial information for farm management. Listed climate-related information includes air temperature and vapour pressure deficit, while geo-spatial data and GIS mapping are also part of the platform. The Farm App additionally lists drought and flood monitoring. These capabilities are part of Erde Agro's broader approach to combining digital technology,

farm data, satellite information and geo-spatial information for agricultural monitoring and management.

Benefits to FPOs

Erde Agro's FPO development approach is focused on helping FPOs create sustainable revenue streams and operate more professionally with technology and business support. The company profile identifies multiple possible FPO revenue streams, including input-supply dealerships, technology implementation fees, soil-testing and collection fees, insurance-premium collection commissions and market linkage. The FPO ecosystem also provides access to agricultural inputs, technology, market connections, soil testing and financial facilities. Erde Agro describes technology and business control, consistent-quality produce at scale, education and technology proliferation, and improved market and input access as important aspects of its FPO model.

FPO Revenue Model

The Erde Agro FPO revenue model includes several business opportunities through which FPOs can generate revenue. These include input-supply dealerships, technology implementation fees, soil-testing and collection service fees, insurance-premium collection commissions and market-linkage activities. Technology implementation can be connected with solutions such as Irriwatch-Hydrosat and satellite-based farm monitoring and advisory services. Through the model, FPOs can develop multiple agriculture-related services for their farmer members while participating in organized market and technology ecosystems. The company profile presents this multi-service model as a way of supporting sustainable FPO revenue generation and professional FPO operations.

Contract Farming

Erde Agro's contract-farming model connects commercial buyers, Erde Agro, farmers and FPOs. Under this model, farmers grow agricultural produce according to agreed standards, while Erde Agro facilitates agreements and provides support. Commercial buyers purchase the produce at agreed prices. The model is intended to create an organized connection between farmers and buyers through FPOs and to support production according to buyer requirements. The company profile does not provide crop-wise contract prices or detailed contractual terms, so the chatbot should not invent those details.

Franchise Outlet Model

Under the Erde Agro Franchise Outlet Model, FPOs can become authorized dealers and centres for agriculture-related products and services for their farmers. The outlet can act as a single contact point through which farmers can access agricultural inputs, seeds, soil testing, finance and the Farm App. The model is intended to improve access to genuine and certified-quality inputs and agriculture-related services while supporting FPO business development. The company profile also connects the model with improved input access, yields and income, reduced middlemen involvement and greater trust in the supply chain. FPOs can use the franchise/dealership model as part of their broader revenue-generation and service-delivery activities.

Quality Categories

Erde Agro's company profile lists several quality categories for agricultural produce: Regular, IPM, Residue Free, Certified Organic, GI Tag and PGS. These categories are presented as part of the company's agriculture and market-linkage ecosystem. The profile specifically connects IPM, residue-free and organic produce with quality-based premium opportunities. However, the source does not

provide detailed definitions, certification procedures, specifications or eligibility requirements for each category. Therefore, the chatbot should only state the categories and the information specifically provided in the company profile and should not create independent definitions for GI Tag, PGS or other categories.

Crops and Products – Spices

Erde Agro's listed crop and product portfolio includes several spices: Red Dry Chilli, Cumin, Coriander Seeds, Fenugreek Seeds, Fennel, Turmeric Dry, Ginger Dry, Black Pepper, Cardamom including Green and Black Cardamom, Nutmeg and Cinnamon. These products are included in the Spices category of the company information. The provided source primarily lists these crops/products and does not provide detailed crop-wise information such as sowing dates, harvesting dates, fertilizer doses, pesticide doses, expected yield or current market prices. Therefore, the chatbot should use the listed crop information without generating unsupported agricultural recommendations.

Crops and Products – Cereals and Grains

The Cereals and Grains category in the Erde Agro crop information includes Maize and Wheat. These are listed as part of the company's crop and product portfolio. The provided source does not include detailed crop-specific cultivation information, sowing or harvesting schedules, fertilizer recommendations, pesticide doses, grading specifications or current prices for Maize or Wheat. Therefore, the chatbot should answer questions about whether these crops are included in the company's listed portfolio but should not invent additional agronomic or commercial information.

Crops and Products – Pulses and Millets

The Pulses and Millets category includes Green Gram, Red Gram/Pigeon Pea, Peas, Chickpeas, Lentils, Black Gram, Pearl Millet, Finger Millet and Sorghum. These crops are included in the company's listed crop and product information. The source does not provide detailed cultivation schedules, sowing or harvesting dates, fertilizer or pesticide doses, current prices or crop-specific grading information for these crops. Therefore, the chatbot should use the crop list as the supported company information and should not generate additional crop-specific details that are not contained in the source.

Crops and Products – Fruits and Others

The Fruits & Others category includes Pineapple from Assam, Orange from Assam and Areca Nut, also referred to as Supari. These products are listed in the company's crop and product information. The source does not provide additional detailed information such as cultivation practices, harvesting schedules, prices, grades or crop-specific input recommendations. The chatbot can therefore confirm that these products are included in the company's listed portfolio but should not provide unsupported crop-specific information.

Company Journey and Major Milestones

Erde Agrotech LLP was established in 2019. In 2020, the company started 160 acres of organic farming for ITC in Gujarat and worked on organic practices and market linkage. In 2022, Erde Agro Ecosystems was established and contract-farming deals were made with Griffith Foods, Terova and Omniactive Health. In 2023, the company signed an MoU with Dudhsagar Dairy and an agreement with ATMA and SMART to support FPCs and FPOs in capacity building. In 2024, the company entered into agreements with Irriwatch-Hydrosat, validated the Irriwatch App, conducted Farm App trials with Olam Food and connected farmers with ITC's Fruits & Vegetables division. On 6 January 2025, the company's business models were registered and

approved by the Ministry of Agriculture and Farmers Welfare, Government of India. In March 2025, the company entered into an agreement with Axis Bank, and in April 2025 it partnered with IFFCO and Reliance as Market Channel Partners. The profile also records partnerships related to IPM training, soil testing, technology, financial services and agricultural organizations, and states that by August 2025 dealerships had been provided to more than 365 FPOs across 12 states.

KAAC Assam Agriculture Value Chain Project

Erde Agro has a partnership with the Karbi Anglong Autonomous Council (KAAC), Assam, for Agriculture Value Chain Development through a private-sector partnership and PPP model. The MoU was signed on 11 November 2025. The project structure includes an SPV under the Companies Act 2013 with a 51:49 Erde Agro-to-KAAC stakeholding ratio. The project is described as having four implementation phases over 24 months and includes an infrastructure investment of ₹300 crore. The project profile also mentions eligibility for a 50% government grant, 3% subvention for seven years and 100% GST return for ten years. The project includes localized collection and primary-processing units and is intended to provide access to six North-Eastern states.

Founders and Leadership

The company profile identifies Sanjiv Masalia and Sukrut Mehta as Founder & Directors of Erde Agro Ecosystems. Sanjiv Masalia is described as having more than 30 years of experience in project management and contract farming, including large-scale farmland development and contract-farming initiatives. Sukrut Mehta is described as having more than 16 years of experience in management accounting and process optimization, along with experience in strategic pricing, financial strategy and IT-driven solutions. The

profile also lists other members and advisors associated with marketing, business development, operations, IT and advisory functions.

Quality & Certification Categories

ERDE AGRO's crop list specifies several quality categories associated with its products. These include **Regular, IPM, Residue Free, Certified Organic, GI Tag, and PGS**. These classifications are part of the company's stated crop and product information and represent the different quality or certification categories mentioned in its product list.

Our Solution & Services

1. Market Linkage through FPO and FPC

Supporting & revenue model:

Direct Connections with reputed buyers & ensuring quality wise better prices & consistent demand

2. Transition to IPM & Organic Farming:

Assistance in transitioning from Conventional farming to Integrated Pest Management (IPM) organic standards, aligned with international guidelines for premium market access.

3. Insurance Solutions:

Risk mitigation for farmers and FPOs against unforeseen challenges.
PMFBY and Private weather based crop insurance.

4. Input Supply Chain Optimization:

Direct tie-ups with Reputed manufacturers, IFFCO, BBSSL, Reliance, etc. to eliminate middlemen, ensuring lower input costs and timely deliveries to farmers. and Revenue Models for FPC/ FPO.

5. Soil Testing Services

Leasing Model:

Monitoring soil conditions to optimize inputs.

Reducing farm costs by preventing the overuse of fertilizers and nutrients.

6. Carbon Credit:

Additional income source through by improving soil carbon and Biochar.

7. Financial Solutions in Partnership with Financial Institution:

For FPO/ FPC :

Collateral-free working capital for operational needs.

Warehouse receipt financing for produce storage.

Working Capital, KCC, AIF (FPO/ FPC), WRF.

For Farmers :

Crop Development Funds.

Financing for Farm Equipment.

8. Satellite-based real-time Farm monitoring system for better management:

Daily notification to prevent against any practices. Monitoring from sowing to harvest. Enhancing Soil & Water Sustainability. Digital Mapping of Farms. Implement precision farming techniques to optimize resource use and significantly reduce farming costs. Provide estimated pre-harvest yield estimates to ensure a consistent and assured supply for buyers. Service cost farmer around Rs.1.00- 1.50 Per Acre/Day.

Erde Agro Farm Mobile Application – User Guide

1. Open the Application

First, download and install Erde Agro Farm from the Apple App Store. After installation, open the application from your mobile device. The application is designed for different agricultural users, including individual farmers, FPO/FPC users, government users, and corporate users. The options and dashboard available after login depend on the type of account assigned to the user.

2. Login to the Application

After opening the application, the user needs to access the account provided for their role. Once authentication is completed, the user is taken to the appropriate dashboard. A farmer will see information related to their farm and crops, while an FPO/FPC or organizational

user can access information covering multiple farmers or agricultural areas.

3. Select or Access Your Farm

After entering the application, the farmer should access their registered farm information. Farm information is important because the application's monitoring features are connected to specific agricultural areas. The farm information can include details such as acreage, crop, irrigation type, soil type, and other agricultural information. The App Store description specifically identifies acreage and crop details as part of the platform.

4. Check Your Crop Information

Once the farm is selected, the user can review the crop information associated with that farm. The crop stage is particularly important because Erde Agro Farm uses crop stage as one of the inputs for its advisory system. The user should therefore make sure that the crop information and relevant agricultural details are correctly maintained so that the monitoring and advisory information has the appropriate context.

5. Check the Farm Dashboard

The farm dashboard is the main place where the user can review the latest information about their agricultural area. Depending on the account and available data, the dashboard provides access to crop-health information, crop-growth indicators, water-stress information, soil-moisture indicators, weather information, advisories, notifications, and reports. The purpose of the dashboard is to provide the user with an overall view of the current condition of the farm.

6. Check Crop Health and NDVI

The user can open the crop-health or monitoring section to review the available crop-health information. Erde Agro Farm uses **Hydrosat–IRRI watch satellite data** for farm monitoring and includes NDVI/crop-health information among its monitoring indicators.

The user should use this information to understand whether the monitored vegetation condition is normal or showing signs of stress. If the application shows a declining or abnormal trend, the user should investigate the corresponding field and review any related advisory or alert.

7. Check Crop Growth

The user can review the available crop-growth information to understand how the crop is developing. Crop-growth indicators can help identify changes in agricultural conditions over time. This is particularly useful because a single day's condition may not provide as much information as a trend showing whether crop development is improving or declining.

8. Check Water Stress

The user should regularly check the water-stress information available for the farm or field. Water-stress monitoring helps identify areas where crops may be experiencing unfavourable water conditions. Erde Agro Farm also includes irrigation needs among the conditions for which users can receive alerts.

If the application indicates increased water stress, the farmer should inspect the relevant field and consider the application's advisory information along with actual field conditions.

9. Check Soil Moisture Indicators

The user can also review the soil-moisture indicators available through the application. These indicators provide additional information about the moisture condition of the agricultural area. They can be considered together with water stress, irrigation information, crop stage, and weather conditions when making farming decisions.

10. Check Weather Information

The user should check the weather information available in the application because weather forecasts are used as an input for the crop advisory system. Weather conditions can influence crop growth, water requirements, and other agricultural activities. Erde Agro Farm combines weather information with crop stage, satellite-based crop growth, and field conditions when generating advisory information.

11. Check Crop Advisory

After reviewing the crop and field information, the user should open the advisory section to see the recommendations available for the farm. The application's advisory system uses information such as **crop stage, satellite-based crop growth, weather forecasts, and field conditions**.

The user should read the recommendation carefully and use it as decision-support information. The advisory should be considered together with actual field observations and appropriate agricultural expertise.

12. Check Notifications and Alerts

The user should regularly check the notification section. Erde Agro Farm can provide notifications related to crop stress, weather impacts, irrigation needs, growth anomalies, and disease/stress indicators derived from satellite monitoring.

For example, if a notification indicates increased crop stress, the user can open the relevant farm information and investigate the field. Notifications are particularly useful because the user does not need to continuously monitor every indicator manually.

13. Check Farm Updates

Farmers can also receive farm-related updates through notifications. The application's version history specifically mentions the introduction of **farm updates through notifications for farmers**.

Therefore, users should keep application notifications enabled so that important farm updates can reach them.

14. Compare Fields

If the user has multiple monitored fields, the field-comparison functionality can be used to compare their conditions. The application provides field comparison as part of its monitoring capabilities.

For example, a farmer or organization may find that one field has better crop health while another field has higher water stress. The comparison helps identify which areas require closer attention.

15. Check Yield Trends

The user can review the available estimated yield information to understand the expected production trend of the monitored agricultural area. The application provides **estimated yield trends**, which should be treated as analytical estimates rather than guaranteed harvest quantities.

Yield information becomes more useful when reviewed together with crop growth, crop health, acreage, and other field indicators.

16. Review Daily Reports

The user can use the reporting functionality to review daily agricultural information. Daily reports are intended to provide structured information about crop growth, irrigation/stress indicators, advisory actions, and farm performance.

A farmer can use these reports to understand what has changed recently and whether the farm requires additional attention.

17. Review Monthly Reports

Monthly reports should be used to understand longer-term farm performance. Instead of looking only at the current day's information, the user can review trends in crop growth, stress, irrigation-related indicators, advisory actions, and overall farm performance.

Monthly reports are particularly useful for FPOs, FPCs, corporate organizations, and other users managing multiple agricultural areas.

How an FPO/FPC User Uses the App

1. Open the FPO/FPC Dashboard

An FPO/FPC user accesses a centralized dashboard rather than focusing on only one individual farm. The application provides FPO/FPC functionality for managing farmer databases, acreage, crop information, crop-health information, advisory recommendations, and reporting.

2. Open the Farmer Database

The FPO/FPC user can access the farmer database to view the farmers associated with the organization. The user can use the available agricultural information to understand each farmer's acreage, crop information, and monitoring status.

3. Check Farmer and Crop Information

The FPO/FPC user can review the crop and farm information associated with individual farmers. This allows the organization to understand which crops are being cultivated, how much acreage is involved, and what the current crop-health situation looks like.

4. Identify Stressed Farms

The FPO/FPC user can review crop-health, water-stress, growth, and other available indicators to identify farms requiring attention. Instead of physically checking every farm first, the organization can use the monitoring information to prioritize farms that appear to require further investigation.

5. Review Advisories

The FPO/FPC user can review the advisory recommendations associated with monitored farms. This helps the organization understand what agricultural recommendations are being generated and support farmers accordingly.

6. Generate and Review Reports

The FPO/FPC user can use the reporting functionality to review farm-wise and regional performance. The developer specifically describes reporting for internal and government use.

How a Corporate User Uses the App

1. Open the Corporate Dashboard

Corporate users involved in contract farming can use the application to monitor agricultural operations across multiple regions. The corporate functionality includes yield estimation, crop-growth indicators, farm-health trends, and region-wise diversification insights.

2. Select a Region

The user can review the agricultural information available for different regions or operational areas. This provides management with a broader view of farming operations rather than requiring individual farm-by-farm physical inspection.

3. Check Crop Growth and Farm Health

The corporate user can review crop-growth indicators and farm-health trends to identify regions or farms where agricultural performance is changing. Trends are particularly useful because they show whether conditions are improving, stable, or deteriorating.

4. Check Estimated Yield

The corporate user can review estimated yield trends to understand potential production performance across monitored farming areas. These estimates can support planning and monitoring but should not be treated as guaranteed production figures.

5. Compare Regions

The user can compare different regions based on available crop-growth, farm-health, yield, and diversification information. This can help management identify high-performing and potentially problematic areas.

Recommended Daily Usage for a Farmer

For practical daily use, a farmer should follow this sequence:

Open the app → check notifications → open the farm → review crop health/NDVI → check crop growth → check water stress → check soil-moisture indicators → check weather → read the crop advisory → inspect any field showing an alert → review the latest farm update.

For longer-term monitoring, the farmer should also review **daily and monthly reports** to understand whether farm conditions are improving or deteriorating.

Conclusion

Erde Agro Farm is a smart agriculture mobile application designed to help farmers, FPOs/FPCs, government organizations, and corporate users monitor and manage agricultural activities more effectively. By combining farm and crop information with satellite-based monitoring, NDVI and crop-health indicators, water-stress analysis, soil-moisture indicators, weather information, crop-growth monitoring, yield trends, advisories, notifications, and digital reports, the application provides users with useful insights into the condition and performance of agricultural fields. Its FPO/FPC and corporate functionalities further enable organizations to monitor multiple farmers, farms, and regions from a centralized platform. Overall, Erde Agro Farm supports data-driven agricultural decision-making, early identification of crop and water-related stress, continuous farm monitoring, and improved planning for better farm management and productivity.

Information & Response Guidelines

This document serves as a structured and reliable source of information about Erde Agro Ecosystems and contains content based on the available official source material, including information related to the company, its agricultural solutions and services, FPOs and FPCs, market linkage, direct input supply, soil testing, crop insurance, finance and credit enablement, Farm App and digital agriculture

solutions, satellite and geo-spatial data, crop monitoring, irrigation management, organic and residue-free farming, contract farming, franchise outlet models, crops and products, quality categories, partnerships, company journey and the KAAC Agriculture Value Chain Development Project. All information provided by a system using this document should remain strictly aligned with the content available in the source material and should be presented accurately, clearly and professionally. The system should use the relevant information from this knowledge base to respond to customer queries and should not introduce, assume, predict or generate facts that are not supported by the available content. If a customer asks about a topic or specific detail that is not covered in this document, the system should clearly communicate that the requested information is currently not available in the knowledge base instead of providing an assumed or fabricated response. Details such as current crop prices, crop-specific sowing or harvesting schedules, fertilizer or pesticide dosages, detailed crop grading or specifications, loan interest rates, specific insurance policy terms, or other technical, commercial or operational information should only be provided when such information is explicitly available in the source material. The system should maintain consistency with the documented information of Erde Agro Ecosystems and should provide responses that are relevant to the customer's query while avoiding unsupported claims or interpretations. For any information that is not covered within this knowledge base, customers may be directed to Erde Agro Ecosystems Pvt. Ltd. for further assistance.
